

For the first step, inspect game.py and fix ONLY the high-score bug.
The current code incorrectly uses:

...

Changed only [game.py \(line 144\)](#). In `Game.update`, the high-score check now compares `current > self.high_score`, so a new best score is saved after a run ends.

To test it, run `python game.py`, play until you hit an obstacle with a score above the saved best, then restart the game and check that **Best** retains the new score. For a quick check, remove or set `dino_highscore.txt` to a low value before playing.

Now implement ONLY Task 2 from the Dino Run README.

Implement the function:

`dino_tint(on_ground)`

Requirements:

1. It receives the boolean `on_ground`.
2. When the Dino is airborne, return an RGB color tuple so the Dino has a visibly different color.
3. When the Dino is on the ground, return `None` so the existing default green color is preserved.
4. Do not modify the existing `Dino.draw()` logic because it already calls `dino_tint()`.
5. Do not modify the high-score code that was fixed in the previous step.
6. Do not implement `on_obstacle_passed()` or `max_jumps()` yet.
7. Keep the change minimal and compatible with the existing Pygame code.

After making the change, explain exactly what you changed and how I can test it.
